What is an octane rating? And how do you use a proper noun? Lucky for you, HowStuffWorks Play is here to help. Our award-winning website offers reliable, easy-to-understand explanations about how the world works. From fun quizzes that bring joy to your day, to compelling photography and fascinating lists, HowStuffWorks Play offers something for everyone. Sometimes we explain how stuff works, other times, we ask you, but we're always exploring in the name of fun! Because learning is fun, so stick with us! Playing quizzes is free! We send trivia questions and personality tests every week to your inbox. By clicking "Sign Up" you are agreeing to our privacy policy and confirming that you are 13 years old or over. Copyright © 2021 InfoSpace Holdings, LLC, a System1 Company Imagine it's 8th-grade homeroom: the bell rings, and you take your seat. Written on the board is the following: $X + Y + Z = \$$ The teacher walks in and announces that solving this equation is your assignment. Teen angst-even more than usual-ensues. That's because this equation can't be solved. Why? Because there's no constant.The above equation is one that marketers encounter each day. But instead of cardigan clad teachers, these professionals answer to hardened CMOs and investors who aren't in a position to gently walk them through it. Brands need to grow, and this equation must be solved-now!There are three factors-X, Y, and Z-to account for in order to drive brand innovation. They aren't easy to obtain, but they certainly are simple. And it all starts with assigning a constant.To form a true strategic platform, one must have X-an audience or target, Y-a felt need or desired benefit, and Z-design DNA or capability.Often, larger organizations are bereft of all three of these, so much so that it can cause paralysis of choice. Startups, on the other hand, often only have one constant to which they cling.Whether it's an engineer applying physics to make a new heart valve (Z), a coder writing an algorithm for a new diet app (Y), or a mom-preneur looking to social media as a way for moms to meet other moms (X), their constant is the key to solving for the other two variables.Big brands should identify the constant they know the most about, then work to develop the other two variables in order to create meaty platforms. It's one of the true keys to making efficient progress, and to quickly pressure-testing for failure points before getting too far down the road. Here's a look at how to break down the process to find your constant:X-Is the AUDIENCE your constant?Do you know your audience? Can you describe them like you would a friend? Can you explain their tastes, fears, likes, dislikes, and characteristics?Or, do you at least know about them? Can you explain how old they are, where they shop, in which type of community they reside?For example, if you know them, you may be working from a fresh segmentation study that really puts a face on a given consumer group. If you know about them, you may be interested in growing your brand's market share with Millennials. Either is a suitable constant from which to work.Y-Is the FELT NEED your constant?This territory becomes a bit more nuanced, but the simple summary of it falls within the following two questions: What does the marketplace need? What is scarce? If you've identified a felt need and have a pretty good answer to those questions, you've probably found your constant here.For example, it's easy to observe that people need energy. It's also easy to observe that energy drinks are not scarce. So, you may observe that people need energy in a way that won't leave them feeling jittery. Alright, now you probably have a constant from which to work. You can now set about identifying who most needs this, and how you'll uniquely deliver it.Z-Is Design DNA your constant?A great example of this is when the R&D team shows up with a new, patent-pending technology. Now you have the Design DNA-the capability-as your constant, and your job becomes determining who needs it, and which felt needs it solves.Any of these three are viable constants and a surefire way to lead your teams beyond the churn that often comes with big brand innovation. Simply identifying your constant will not only ensure you create substantive innovation platforms, but that you lead your team towards growth with the best, most competitive foot forward.The principle in real lifeThe Innovation Equation comes to life in a new brand example like Chobani and its founder Hamdi Ulukaya.As Ulukaya tells it, he was running a struggling cheese brand when he literally pulled a direct mail piece advertising a tired old yogurt factory from his trash can and decided to take a look on a whim. Ulukaya's constant fell in his lap (or, more accurately, his trash can).He had the Design DNA (Z) that would ultimately enable his breakthrough: the dormant yogurt plant. He spent two more years after that fateful factory tour figuring out whom he would serve (X), and why his new product had a right to exist (Y). The Innovation Equation that drove Greek yogurt from less than 1% of the category to nearly 60%, and continues to drive double-digit year-over-year growth, was born.These principles are drawn from Hunter Thurman's new book, Brand Be Nimble: How Big Brands Can Thrive by Innovating Like Startups. As founder of the innovation lab Thriveplan, the book is a result of Thurman's global experience across every consumer packaged goods category, complemented by his work as an innovation mentor to Cincinnati's startup accelerator, The Branderly. Would you like a free CAS and graphing calculator program on your computer? Here's a free add-in from Microsoft that will make Word and OneNote into top-notch mathematics programs. Microsoft's new Mathematics Add-in for Word 2007 and 2010 is a great tool to work with math in Office. It lets you create beautiful graphs and solve equations without purchasing an expensive math program. To get started, download the Microsoft Mathematics Add-in (link below), and install as normal. Make sure you've exited Word and OneNote before you begin the setup. The Math add-in generates beautiful 3D graphs powered by DirectX, so you'll be prompted to install the latest version of DirectX at the end of the installation. Next time you open Word 2010 or 2007, you'll notice a new Mathematics tab in the ribbon. Here you can insert equations, graphs and more right into your Word documents. OneNote 2010 will have a similar Mathematics tab, though OneNote 2007 will not as it does not have the ribbon. OneNote works especially good for use with math since it uses a more free-form style of editing. OneNote includes one very interesting feature: you can insert equations with digital ink. While editing a new equation, click Ink Equation to start writing the equation in on your touch screen. This will open a new window where you can write out your equation on your touch screen or Wacom tablet. You can even write equations out with your mouse, though generally it would be much quicker to type them in! Notice that the app is automatically showing its interpretation of the written equation above. If it seems like it's getting it wrong, keep writing; it often will autocorrect as you finish your equation. Alternately, you can insert a variety of pre-built equations by clicking the down-arrow under the Equation button in either application. More equations are available from Office.com if you'd like to add to your gallery. In Word, you'll have access to a wide variety of equation editing tools that are built-in. OneNote includes similar tools, but they are slightly less full-featured. Once you've got an equation entered you'd like to see, click the Graph button. Depending on the equation, you can plot the graph in 2D or 3D. This will open the Graph addin where you can choose the zoom level, wireframe, animation, and more. This produces very nice complex graphs. Click Insert to add the graph to your document. You can even use the Math addin to solve, integrate, or differentiate your equations. Here we differentiated, then integrated it back. This is a simple example, but the Math plugin can handle much harder equations with no problem. This can be a great study aid for students, and is almost like a basic free Mathematica! Here's another equation where we solved for x. Works quite good. The Math Add-in can handle rather complex equations, but when we tried to solve the Binominal Theorem for x, we received an error message. Still, we were amazed at how much this addon could do! No matter what level of math you're currently taking, the Math Add-in is a great tool to help you advance your math skills with software you already have. No need to purchase expensive graphing calculator programs; this simple addin from Microsoft can make Office into a nice CAS and graphing suite! If you'd like to make Word a great tool for more educational and research work, check out the Chemistry Add-in for Word as well!
