**Universal Remote  
Instruction Manual**  
Control Remoto Universal  
Manual de Instrucciones

Once the final pool failure takes place the failover is initiated and the observer reports as disabled for this configuration. Click the "CREATE NEW HOST" button. \$ /usr/dbvisit/standby/dbvctl -d cdb1 -o activate Automatic Failover The simplest way to test the automatic failover is to turn off the network adapter on the primary server. You can read more about the Failover Mode here. Repeat for the standby node, to make sure all sent logs are applied. \$ /usr/dbvisit/standby/dbvctl -d cdb1 -o open When you need to switch it back to regular standby mode, either stop and start the standby database, or do a restart. The start and restart action varies depending on which server they are run from. Use the username "admin" and the password "admin". You will be presented with the login screen. TL-DR If you want to jump straight into playing with the product, you can use the Vagrant build available here. You now have a functioning standby database. Installation Make sure the "/etc/hosts" file or DNS contains entries for all servers. Click on the "MANAGE HOSTS" tile. The "Failover Mode" is now listed against the configuration, along with the "Stop Monitoring" button, should you wish to do so. Click the "Close" button on the confirmation. Enter the host or IP address of the observer. You will need a safer passphrase than the one used here. Click the "DATABASE ACTIONS" tile. Hovering over the alert in the Alert History displays the number of failed checks. To add the second host, which will hold the standby database, click the "+NEW" button. Assumptions You are using version 9.0 of the Dbvisit Standby product and have a license key (trial or real). The standby server has a software only installation. 192.168.56.101 ol7-19-db1.localdomain ol7-19-db1.192.168.56.102 ol7-19-db2.localdomain ol7-19-db2.192.168.56.103 ol7-19-console.localdomain ol7-19-console As the "root" user, create the Dbvisit base directory on each server using the following commands. Click the "+NEW" button. Back to the Top. Dbvisit Standby works equally well on Standard Edition databases, unlike Oracle, which is an Enterprise Edition option. Enter the default passphrase "admin900" and click the "SAVE" button. cd /etc/sysconfig/network-scripts ifdown eth1 When we configured the observer we used the default values, which mean it polls the server every 120 seconds, and will retry 5 times before performing a failover. export NODE1\_HOSTNAME=ol7-19-db1 export NODE2\_HOSTNAME=ol7-19-db2 export DBVISIT\_PASSPHRASE=MyPassphrase123 ./install-dbvisit --batch-install --force ./dbvisit-base /usr/dbvisit --components core ./dbnet-local-host \${NODE1\_HOSTNAME} ./dbnet-local-port 7890 ./dbnet-remote-host \${NODE2\_HOSTNAME} ./dbnet-remote-port 7890 ./dbvagent-local-host \${NODE1\_HOSTNAME} ./dbvagent-local-port 7891 ./dbvagent-passphrase \${DBVISIT\_PASSPHRASE} ./dbvisit/standby/dbvnet -d start ./dbvisit/dbvagent/dbvagent -d start On the secondary server issue the following commands. Click the "MANAGE CONFIGURATIONS" tile. Enter the host details and the passphrase you used during the installation. unzip -q dbvisit-standby\*.zip tar xf dbvisit-standby\*.tar cd dbvisit/installer On the primary server issue the following commands. If you are using local network firewalls between servers you will make sure all necessary ports are opened. \$ /usr/dbvisit/standby/dbvctl -d cdb1 -o status Send logs from primary server using this command. Most management tasks can be done using the console, but the examples in the rest of the article will use the command line dbvctl utility. This will allow you to go straight to the Standby Creation section. Select the configuration you just defined, and enter the license number. Home > Articles > Misc > Here Dbvisit Standby is an alternative to Oracle Data Guard for creating and managing standby databases. In this case we installed it on the console machine. Click the "+ NEW" button next to the "Add a Dbvisit Observer" message. I also used the default of "Create Standby Database". A failover is initiated using the following command on the standby server. Click the "BACK TO MENU" button. Click on the lightning bolt icon to start/stop the daemon processes. \$ /usr/dbvisit/standby/dbvctl -d cdb1 -o restart Switchover To run a graceful (and reversible) switchover, issue the following command on either of the servers. Most of them will be pre-filled. Wait while all the actions complete. Startup/Shutdown of Databases The following stop, start and restart commands can be used on the primary or standby database. The Installing Dbvisit Standby document provides detailed information for the installation of the product on different operating systems and for different database configurations. Select the primary node and click the start button to automate the sending of logs. mkdir /usr/dbvisit/bin/cnsh -R oracle-oinstall /usr/dbvisit As the "oracle" user, prepare the software for installation on each server. Select the primary host, agree to the license agreement, then select the primary instance. In this example we added the following to all three servers. The resulting page looks quite long, but you will mostly use defaults on your first attempt. \$ /usr/dbvisit/standby/dbvnet -d cdb1 -o start \$ /usr/dbvisit/standby/dbvnet -d cdb1 -o restart You can check the status of the primary or standby database using the following command. In this article we will be focusing on the Linux installation and configuration for a simple standby setup. Click the "SUBMIT" button. The primary server has a database running in archive log mode, and there is an entry in the "/etc/oratab" file for it. Click the "Monitor" link that is now present for the configuration. \$ /usr/dbvisit/standby/dbvctl -d cdb1 Read-Only Standby To open the standby database in redo-only mode, simply issue the following command as the "oracle" user on the standby server. \$ /usr/dbvisit/standby/dbvnet -d cdb1 -o switchover To switch back, just repeat the command. The following information may help you to tailor the installation for your own installation. You have a third server with an operating system on to use as the console server. Regards Tim... On the standby, the database is put recovery mode. export NODE1\_HOSTNAME=ol7-19-db1 export NODE2\_HOSTNAME=ol7-19-db2 export DBVISIT\_PASSPHRASE=MyPassphrase123 ./install-dbvisit --batch-install --force ./dbvisit-base /usr/dbvisit --components core ./dbnet-local-host \${NODE2\_HOSTNAME} ./dbnet-local-port 7890 ./dbnet-remote-host \${NODE1\_HOSTNAME} ./dbnet-remote-port 7890 ./dbvagent-passphrase \${DBVISIT\_PASSPHRASE} ./dbvisit/standby/dbvnet -d start /usr/dbvisit/dbvagent/dbvagent -d start On the console server we issue the following commands. Click the "LICENSE DBVISIT" button. Standby Creation Once the installation is complete you should be able to get to console using a URL like ". In this case I've used Oracle Linux 7 and Oracle Database 19c. For more information see. Hope that helps. I accepted the defaults for everything except the temp locations. You have two servers (physical or VMs) with an operating system and Oracle installed on them. You can enter your license key now, but we will add it later. Select the "Operation mode" of "Failover Mode" and click the "SAVE SETTINGS" button. Once complete, either click outside the task window, or scroll to the top and click the "Close" button. You can then select the secondary host, and give details about the standby database. Notice, in addition to installing the software, we've started the "dbnet" and "dbvagent" services. ORACLE\_BASE=/u01/app/oracle/product/19.0.0/dbhome\_1 ORACLE\_SID=cdb1 Primary hostname: ol7-19-db1 Standby hostname: ol7-19-db2 Console hostname: ol7-19-console For more complex installations, like those involving RAC, check out the Installing Dbvisit Standby documentation. To add the first host, which holds the primary database, click the "+NEW" button. Select the configuration you defined previously, and click the "NEW DATABASE" option. From the console click the "MANAGE CONFIGURATIONS" tile. Failover Failover should only be used if you need to activate the standby database in the absence of the primary database. You can change the password once logged into the console. Notice, we start the "dbvserver" service and the observer. Click the "UPDATE STANDBY LICENSE" tile. On the primary the database is started. mkdir -p -9.0 cd -9.0 cp /path/to/software/dbvisit-standby\*.zip . Click the "CREATE STANDBY DATABASE" tile. \$ /usr/dbvisit/standby/dbvctl -d cdb1 Apply logs on the standby server using the following command. The console server doesn't contain any Oracle software, but I've kept the OS installation and user name the same for consistency. export CONSOLE\_HOSTNAME=ol7-19-console ./install-dbvisit --batch-install --force ./dbvisit-base /usr/dbvisit --components dbvserver,observer -d dbvserver-local-host \${CONSOLE\_HOSTNAME} -d dbvserver-local-port 4433 /usr/dbvisit/dbvserver/dbvserver -d start nohup /usr/dbvisit/observer/observersvc -f /usr/dbvisit/observer/conf/observer.conf & The installation of all servers is now complete. From 9.0.02 onward, you can configure an observer for automatic failover. It's similar to those used on the primary, but with the local and remote servers swapped as we are on a different machine. Click on the task in the "View Task History" section on the bottom-left of the console.
