## Samsung galaxy note edge latest android version

[Embed width = "840"] [/ Embed] The Galaxy Note Edge is unique, but that may not be enough for many. Until recently, most smartphones generally had the same form factor – a glass plate, surrounded by a square body and becoming boring. It is not often that we see a new form factor readily available for the public purchase. Actually, it almost never happens when it comes to smartphone world. Believing that the industry needed a slight push on the hardware front, Samsung announced something very fresh next to the Galaxy Note 4, returns to IFA 2014. Related: best cases for the Note edge. That Samsung Galaxy device The Galaxy border note. Resembles note 4, but it is even different. Instead of offering a flat glass plate on the front, the display side curves gently around the right edge. Samsung is obviously trying to push the borders on the way we use our devices, but is that enough to justify the purchase of this device the Galaxy Note 4? Does it offer enough of a traditional feature that people get behind? Discover this and more. In our Samsung Galaxy Open Board Notes! Here is where the border note stands out of the competition. It looks exactly like a Galaxy Note 4, but with a huge change. Obviously we are talking about the right edge of the display. Change the way we use the phone, of course, but in all the other aspects, you can absolutely say that it is a note device. The Edge uses the same rear in leatherette, polished-plastic front (complete with a large, Tactile Home button), and on the brushed metallic sides as the note 4. The right side of the device looks almost like someone melted the glass and leave it cool down. The curve is where you can see the new treatment experience that the board brings, in the software and hardware. Due to the added slippery-ness of the board, there is a slight lip on the screen, which Samsung hopes to help aid to keep it. Although we have haven't felt the phone still completely, we are at the even more nervous than most other phones on most. Now that the display wraps around two edges of the device, there is much more than a breaking possibility of once it has fallen. Because the right edge is the main phone feature, cracking it would be harmful to the user experience. The arrangement of the buttons has been activated a little on the edge, moving the power button for the upper part of the device. It is certainly a change, especially since practically every other Samsung phone has had the power button on the right side. Waking up the device is still very easy, thanks to the Tactile Home button, but it is still strange to get used to reach up higher to put it in other standby. The edges of the device still have the brushed metallic appearance to them, and it gives the board a beautiful, feeling of quality in hand. The back is still removable and covered in imitation leather Family plastic support from other known devices. We are at Happy Samsung has decided to include a removable back and first quality materials around the device, as you still do for a devil of a great phone sensation. It is honest, this device looks strange. A good one strange, though. It generates a lot of looks from people, and usually followed with a what's happening with your phone? – although generally positive reactions, it still gets a lot of looks in public. Let's just say that this device has aroused our interest in design terms. We have aren't collecting it every day because it is the best all-around device, but above all because it is something Change the software and the hardware experience completely, and we are at continuously excited to see how fairs from the first day to day. Obviously The display on the Edge note is one of the largest differences between this laptop and the most traditional galaxy Note 4. The 5.6-inch display does not only seem unique, actually has little more than 2560 x 1600 quad resolution. Of course, the 160 pixels plus on the right side of the display display Really improve vision experience in any way, as they are reserved for a number of panels and controls. The display may have a unique advantage to it, but the rest of the features is rather typical of Samsung, which means the same Signature saturation and high loyalty. The text is as always as always, and I still enjoyed the media and games just as I did on the note 4. said this, I must admit that the extra curve can be more than a bit of distraction sometimes, and I hadn't gone too happy at any time I sparked accidentally and then covered a fragment of my Netflix or YouTube video on top. Returning to the curve itself, it is important to note that it can actually turn on the rest of the display. This means that you can use the curve as a clock on a nocturnal support or as a quick way for some basic notifications. Touch awareness here is as good as expected, even if the interaction is limited to Swips and touches. I entered more information about how the curve changes the experience a little more ahead in the revision. The great Takeaway is that, yes, the display has a higher resolution, but it really doesn't differ in the great scheme of things. The flu of the brother of the border returns here with the handset packing the same Snapdragon 805, ADRE 420 CPU and 3 GB RAM as note 4. Obviously, this is not a bad thing. The border of the note is absolutely a beast, providing a reliable and pleasant experience. It follows note 4, the note Edge Pack one of the most smoothing iterations of TouchWiz to date. While there is a rare moment of babble or delay, they are few and far from each other. In other words, regardless of what you leave you, the border of the note should be able to take everything to stride. The new addition of the panels in the curve don't – A "e" T deducted from the general experience found the device, Like everything runs smoothly. I noticed that some new animations have been added to attract attention to the side, since all the apps slip from the edge – "but these are only aesthetic changes. Apart from the curved display and its capacity, the note of galaxy the border offers basically everything that is obtained with its peak brother, making this of the most compatible devices with features currently available. Usual Samsung features as a removable rear cover, which allows access to the replaceable battery, to the SIM slot and to MicroSD card slot, make a return here. Quality is decent, and while the external speaker becomes rather strong, it is tormented with the problems that influence any speaker placed on the back of the phone. The recent Samsung additions like the monitor of the phone heart rate and multiple microphone configuration, which helps with the recording of specific spectrum parts, also make a return with the Note Edge. all course, the main draw with any note device is the Stylus S-Pen, which provides a precision and note use of taking ability, as easily clipping pieces screen for later use, access to note S and the memo of the action. The same pen has also been improved to allow an even more fine writing experience. The S-Note application is now supplied with known photo, which captures the lines and drawings of any scene, and makes them editable, which is great to create signs, blackboards or any open presentation to your creativity. Everything that was said and done, while the S-Pen can turn out to be a full feature of the edge of the galaxy note, feels a bit strange, especially when you literally expect it, falling from the edge. As required by a device with such a big factor shape, battery life is quite impressive. The 3,000 mAh unit is For about four hours of screen time, with standby time and other energy consumption characteristics that allow you to reach at least one day and a means of use more opportunities. While my use may have been a little higher than most, what is appreciated is Samsung's fast charging features, which allows you to recharge the device very quickly. Keep with the galaxy note 4 technical specifications, the edge of the note note A REAR SHOOTER MEETING 16, bringing expected Samsung with quality, and various video modes. That said, I still had a significant problem with the experience experience with the note board, a lot of checks that are used with various applications have been moved to curve a, a, which is actually very useful, but demonstrates of Be a bad idea, in the case of use of the camera. While it is still getting access to some buttons on the screen to adjust the settings, commands and quick settings are all on the curved edge, whose ergonomics are unfortunately not done for the smartphone camera shooting. I is not Never was able to take pictures with one hand, how to reach the shutter button was rather embarrassing, and constantly caused a feeling of falling phone. The positioning of the controls don't destroy the experience entirely, but this is certainly an example of how it needs innovation like this much more thought put into it. The quality of the photos taken will always remain the same though, between Which high levels of saturation that makes for excessively lively photos, which are still well received by the General User. Various modes are available, including HDR and selective, which ends up being a successful or lose feature. Poor lighting performance is a bit helped by the optical image stabilization, but the photos make the details lose and become rather grainy darker the situation becomes. That being said, the images are still reliable good in well-lit situations, which should be pleasant for most users. Finally, when it comes to software, TouchWiz makes his return throughout his glory, but now with a new element for Welcome with the screen curve. Before arriving at the curve, the software experience that WEA VE covered in the Galaxy Note 4 revision continues here, especially with regards to multi-tasking. While TouchWiz saw an update regarding his aesthetics, there is still a saturation during the available functions, as you will see in a list too long setup. Multi-tasking ease is a focus with the last iteration of TouchWiz, and clearly seeks it in the new recent Apps screen, which also includes a new button to quickly activate the multi-window function. All numerous multi-tasking has everyone to make its appearance with the note Edge as well. multi-tasking is, of course, a large part of the known experience, is actually at its most capable on the note edge, especially When creating the curved edge. A complete panel of icons or folders that you can customize to allow links to favorite applications at any time, which is one of my favorites aspects of this new curved display. A variety of other panel specifications, such as data monitoring, a dedicated news ticker, one that will show notifications in real time, and a ruler to quickly measure everything is available here. You also have the chance to customize the panel where you have the chance to include a small sentence or a drawing, to really do it your own. The curve also ends up being annoying in some cases. While not having controls on the screen during video viewing it is appreciated, horrible camera controls are a down. The software disappointment does not use the curve to a good extent, although not all situations produces a good experience. It is certainly a great place to put the perpetuo shortcuts, and a good way to easily control the time, but if these features are sufficient to justify the need for a edge is still unknown. Prices do not turn out to be a In the case of the Galaxy border note, with the device on occasion it costs \$ 150 greater than the Galaxy Note 4, which is essentially the same device, except for the edge. Whether the edge is enough to justify the price difference is entirely to you, but everyone has said done, the overall experience is largely the same thing with the relatively cheaper Galaxy Note 4. If you have us to The Samsung Galaxy border note! Different, it's the best way to Experience when using the border of the galaxy note. While the steep price point of this smartphone is certainly an inconvenience, the charm of something new is decidedly undeniable. While the differences between the edge of the galaxy note and the galaxy note 4 may not be sufficient to justify the significant difference in the price, if you are someone who is braving the exclusivity, and basically they want something unique, the edge of the Galaxy note It could only be the device you are looking for.
